- 5 Causal Nets
- 6 Distributed Runs

Definition (Petri net)

A **Petri net** N is a triple (P, T, F) where:

- P is a finite set of **places**,
- T is a finite set of **transitions** with $P \cap T = \emptyset$, and
- $F \subseteq (P \times T) \cup (T \times P)$ are the **arcs**.^a

Places and transitions are generically called **nodes**.

^a F is also called the **flow** relation.

Example

$$P = \{A, B, C, \dots\}$$

$$T = \{a, b, c, \dots\}$$

$$F = \{(A, a), (a, B), (B, b), \dots\}$$

Definition (Marking)

- A **marking** M of a net $N = (P, T, F)$ is a mapping $M : P \rightarrow \mathbb{N}$.
- For net $N = (P, T, F)$ and marking M_0 , the tuple (P, T, F, M_0) is called an **elementary system net** with **initial marking** M_0 .

Intuition:

- A marking can be seen as a **multiset** of places.
- It defines a distribution of **tokens** across places.
- Tokens are depicted as black dots.

Remark: In **generic** (= non-elementary) system nets, several types (colours) of tokens can be distinguished.

Definition (Enabling and occurrence of a transition)

Let (P, T, F, M) be an elementary system net.

- Marking M **enables** a transition t if $M(p) \geq 1$ for each place $p \in {}^\bullet t$.
- Transition t can **occur** in marking M if t is enabled in M .
- Its **occurrence** or **firing** leads to marking M' , and defined for place $p \in P$ by:

$$M'(p) := M(p) - F(p, t) + F(t, p)$$

where we represent F by its characteristic function.

Definition (Step sequence)

Let (P, T, F, M_0) be an elementary system net.

- A sequence of transitions $\sigma = t_1 t_2 \dots t_n \in T^*$ is a **step sequence** if there exist markings M_1, \dots, M_n such that

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_{n-1}} M_{n-1} \xrightarrow{t_n} M_n.$$

- Marking M_n is then **reached** by the occurrence of σ , denoted $M_0 \xrightarrow{\sigma} M_n$.
- M is a **reachable marking** if there exists a step sequence σ such that $M_0 \xrightarrow{\sigma} M$.

Marking Graph

Definition (Marking graph)

The **marking graph** of a net N has as nodes the reachable markings of N and as edges the corresponding steps of N .^a

^aSince firing an (enabled) transition in a marking yields a unique successor marking, marking graphs are a **deterministic** LTS.

Examp

A sample elementary system net

... and its marking graph

Interleaving semantics

The marking graph represents the **interleaving semantics** of a Petri net.

The interleaving thesis

The total order assumption is a reasonable abstraction, adequate for practical purposes and leading to nice mathematics.

Interleaving vs. True Concurrency I

The interleaving thesis

The total order assumption is a reasonable abstraction, adequate for practical purposes and leading to nice mathematics.

The true concurrency thesis

The total order assumption does not correspond to physical reality and leads to awkward representations of simple phenomena.

Motivation

Example 15.1 (cf. Example 14.20)

Example 15.1 (cf. Example 14.20)

- Both nets have identical sequential runs and isomorphic marking graphs (*a* occurs before *b*, or vice versa).
- But the left net, in contrast to the right one, allows the simultaneous execution of *a* and *b*.
- Interleaving semantics cannot distinguish these nets!
- To do so requires a finer perspective on the execution of transitions.

Interleaving vs. True Concurrency II

- In **interleaving** semantics, a system composed of n independent components

has $n!$ different sequential runs.

- Its marking graph has 2^n states.
- In **true concurrency** semantics, it has only one (non-sequential) execution (“distributed run”).

Interleaving vs. True Concurrency II

- In **interleaving** semantics, a system composed of n independent components

has $n!$ different sequential runs.

- Its marking graph has 2^n states.
- In **true concurrency** semantics, it has only one (non-sequential) execution (“distributed run”).

Roadmap:

Net \mapsto {sequential runs} $\hat{=}$ marking graph (as seen)
Net \mapsto {distributed runs} (today) $\hat{=}$ branching process (next lecture)

- Distributed runs are special **causal nets**, which take the causal order of transitions into account.
- Branching processes are special **occurrence nets**, which additionally represent choices for resolving conflicts between transitions.

Interleaving semantics

Sequential runs (step sequences)^a

$$\begin{aligned} AC &\xrightarrow{a} BC \xrightarrow{b} AC \xrightarrow{c} D \\ AC &\xrightarrow{d} AE \xrightarrow{a} BE \xrightarrow{b} AE \xrightarrow{a} \dots \end{aligned}$$

True concurrency semantics

Definition 15.2 (Elementary system net – extending Definition 14.6)

An elementary system net is a tuple $N = (P, T, F, M_0)$ where

- P is a countable set of **places**,
- T is a countable set of **transitions** with $P \cap T = \emptyset$,
- $F \subseteq (P \times T) \cup (T \times P)$ are the **arcs** such that, for every transition $t \in T$, $\bullet t$ and t^\bullet are non-empty and finite, and
- $M_0 : P \rightarrow \mathbb{N}$ is the **initial marking**.

Places and transitions are generically called **nodes**.

- 3 Nets with Infinite Node Sets
- 4 The True Concurrency Semantics of Petri Nets
- 5 Causal Nets
- 6 Distributed Runs

A distributed run of a net is a partial order represented as a net whose basic building blocks are simple nets denoted as **actions**.¹

¹Not to be confused with the notion of action in transition systems.

A distributed run of a net is a partial order represented as a net whose basic building blocks are simple nets denoted as **actions**.¹

Definition 15.4 (Action)

An **action** is a labelled net $A = (Q, \{v\}, G)$ with $\bullet v \cap v^\bullet = \emptyset$ and $\bullet v \cup v^\bullet = Q$.

¹Not to be confused with the notion of action in transition systems.

A distributed run of a net is a partial order represented as a net whose basic building blocks are simple nets denoted as **actions**.¹

Definition 15.4 (Action)

An **action** is a labelled net $A = (Q, \{v\}, G)$ with $\bullet v \cap v^\bullet = \emptyset$ and $\bullet v \cup v^\bullet = Q$.

Actions represent transition occurrences of elementary system nets. If A represents transition t , then the elements of Q are labelled with in- and output places of t , and v is labelled with t .

¹Not to be confused with the notion of action in transition systems.

Actions

A distributed run of a net is a partial order represented as a net whose basic building blocks are simple nets denoted as **actions**.¹

Definition 15.4 (Action)

An **action** is a labelled net $A = (Q, \{v\}, G)$ with $\bullet v \cap v^\bullet = \emptyset$ and $\bullet v \cup v^\bullet = Q$.

Actions represent transition occurrences of elementary system nets. If A represents transition t , then the elements of Q are labelled with in- and output places of t , and v is labelled with t .

Actions Represent (Repeated) Transition Occurrences

Example 15.7

A **causal net** constitutes the basis of a “distributed” run.

Causal Nets Informally

A **causal net** constitutes the basis of a “distributed” run.

It is a (possibly infinite) elementary system net with the following properties:

- (1) It has **no place branches**: at most one arc ends or starts in a place.
- (2) It is **acyclic**, i.e., no sequence of arcs forms a loop.
- (3) Each sequence of arcs (flows) has a **unique first element**.
- (4) The **initial marking** contains all places without incoming arcs.

Causal Nets Formally

A **causal net** is a (possibly infinite) net with the following properties:

- (1) It has **no place branches**: at most one arc ends or starts in a place.
- (2) It is **acyclic**, i.e., no sequence of arcs forms a loop.
- (3) Each sequence of arcs (flows) has a **unique first element**.
- (4) The **initial marking** contains all places without incoming arcs.

Definition 15.8 (Causal net)

A (possibly infinite) net $K = (Q, V, G, M_0)$ is called a **causal net** if

- (1) for each $q \in Q$, $|\bullet q| \leq 1$ and $|q \bullet| \leq 1$,
- (2) the transitive closure (called **causal order**) G^+ of G is irreflexive,
- (3) for each node $x \in Q \cup V$, the set $\{y \mid (y, x) \in G^+\}$ is finite (i.e., G is **well-founded**), and
- (4) M_0 equals the minimal set of places in K under G^+ , i.e.,

$$M_0 = {}^\circ K := \{q \in Q \mid \bullet q = \emptyset\}.$$

Causal Nets Formally

A **causal net** is a (possibly infinite) net with the following properties:

- (1) It has **no place branches**: at most one arc ends or starts in a place.
- (2) It is **acyclic**, i.e., no sequence of arcs forms a loop.
- (3) Each sequence of arcs (flows) has a **unique first element**.
- (4) The **initial marking** contains all places without incoming arcs.

Definition 15.8 (Causal net)

A (possibly infinite) net $K = (Q, V, G, M_0)$ is called a **causal net** if

- (1) for each $q \in Q$, $|\bullet q| \leq 1$ and $|q \bullet| \leq 1$,
- (2) the transitive closure (called **causal order**) G^+ of G is irreflexive,
- (3) for each node $x \in Q \cup V$, the set $\{y \mid (y, x) \in G^+\}$ is finite (i.e., G is **well-founded**), and
- (4) M_0 equals the minimal set of places in K under G^+ , i.e.,

$$M_0 = {}^\circ K := \{q \in Q \mid \bullet q = \emptyset\}.$$

Note: The “runs” of the nets in Examples 15.3 and 15.7 (with appropriate initial markings) are all causal nets.

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Proof (by contraposition).

- Suppose that $p \in M_j \cap t_k^\bullet$ for some $p \in V$ and some $0 \leq j < k$.

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Proof (by contraposition).

- Suppose that $p \in M_j \cap t_k^\bullet$ for some $p \in V$ and some $0 \leq j < k$.
- This is impossible for $j = 0$ as, by Definition 15.8, no place in M_0 has incoming arcs, and thus $M_0 \cap t^\bullet = \emptyset$ for each $t \in T$.

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Proof (by contraposition).

- Suppose that $p \in M_j \cap t_k^\bullet$ for some $p \in V$ and some $0 \leq j < k$.
- This is impossible for $j = 0$ as, by Definition 15.8, no place in M_0 has incoming arcs, and thus $M_0 \cap t^\bullet = \emptyset$ for each $t \in T$.
- Hence, $j > 0$. Given that $p \in M_j$ and $p \notin M_0$, it follows $p \in t_i^\bullet$ for some $0 < i \leq j$. (Before reaching M_j , some transition must have placed a token in p .)

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Proof (by contraposition).

- Suppose that $p \in M_j \cap t_k^\bullet$ for some $p \in V$ and some $0 \leq j < k$.
- This is impossible for $j = 0$ as, by Definition 15.8, no place in M_0 has incoming arcs, and thus $M_0 \cap t^\bullet = \emptyset$ for each $t \in T$.
- Hence, $j > 0$. Given that $p \in M_j$ and $p \notin M_0$, it follows $p \in t_i^\bullet$ for some $0 < i \leq j$. (Before reaching M_j , some transition must have placed a token in p .)
- Thus $t_i, t_k \in {}^\bullet p$ with $t_i \neq t_k$, as G is well-founded.

Properties of Causal Nets

In a causal net places can be marked at most once.

Lemma 15.9

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Proof (by contraposition).

- Suppose that $p \in M_j \cap t_k^\bullet$ for some $p \in V$ and some $0 \leq j < k$.
- This is impossible for $j = 0$ as, by Definition 15.8, no place in M_0 has incoming arcs, and thus $M_0 \cap t^\bullet = \emptyset$ for each $t \in T$.
- Hence, $j > 0$. Given that $p \in M_j$ and $p \notin M_0$, it follows $p \in t_i^\bullet$ for some $0 < i \leq j$. (Before reaching M_j , some transition must have placed a token in p .)
- Thus $t_i, t_k \in {}^\bullet p$ with $t_i \neq t_k$, as G is well-founded.
- But every place in a causal net has at most one incoming arc. So also p , contradicting $t_i, t_k \in {}^\bullet p$ with $t_i \neq t_k$.

Boundedness of Causal Nets

Lemma

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Theorem 15.10 (Boundedness of causal nets)

Every causal net is one-bounded, i.e., in every reachable marking every place will hold at most one token.

Boundedness of Causal Nets

Lemma

Let $K = (Q, V, G, M_0)$ be a causal net. Then every step sequence

$$M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k$$

of K satisfies $M_j \cap t_k^\bullet = \emptyset$ for all $j \in \{0, \dots, k-1\}$.

Theorem 15.10 (Boundedness of causal nets)

Every causal net is one-bounded, i.e., in every reachable marking every place will hold at most one token.

Proof.

Follows directly from the fact that the initial marking M_0 is one-bounded, and by Lemma 15.9. \square

Lemma 15.11 (Absence of superfluous places and transitions)

Let $K = (Q, V, G, M_0)$ be a causal net. Then there exists a (possibly infinite) step sequence $M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k \xrightarrow{t_{k+1}} \dots$ of K such that $Q = \bigcup_{k \geq 0} M_k$ and $V = \{t_k \mid k > 0\}$.

Lemma 15.11 (Absence of superfluous places and transitions)

Let $K = (Q, V, G, M_0)$ be a causal net. Then there exists a (possibly infinite) step sequence $M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k \xrightarrow{t_{k+1}} \dots$ of K such that $Q = \bigcup_{k \geq 0} M_k$ and $V = \{t_k \mid k > 0\}$.

A causal net thus contains no superfluous places and transitions, as every place is marked and every transition is fired in the above step sequence.

Completeness of Causal Nets II

Lemma (Absence of superfluous places and transitions)

Let $K = (Q, V, G, M_0)$ be a causal net. Then there exists a (possibly infinite) step sequence $M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k \xrightarrow{t_{k+1}} \dots$ of K such that $Q = \bigcup_{k \geq 0} M_k$ and $V = \{t_k \mid k > 0\}$.

Proof.

Let $\text{depth} : Q \cup V \rightarrow \mathbb{N}$ give a node's (maximal) “distance” from the initial marking:

$$\text{depth}(p) := \max \left\{ \frac{d}{2} \mid d \in \mathbb{N}, \exists p_0 \in M_0 : (p_0, p) \in G^d \right\}$$

$$\text{depth}(t) := \max \{ \text{depth}(p) \mid p \in \bullet t \}$$

where $G^0 := \text{id}_Q$ and $G^{d+1} := G \circ G^d$.

Completeness of Causal Nets II

Lemma (Absence of superfluous places and transitions)

Let $K = (Q, V, G, M_0)$ be a causal net. Then there exists a (possibly infinite) step sequence $M_0 \xrightarrow{t_1} M_1 \xrightarrow{t_2} \dots \xrightarrow{t_k} M_k \xrightarrow{t_{k+1}} \dots$ of K such that $Q = \bigcup_{k \geq 0} M_k$ and $V = \{t_k \mid k > 0\}$.

Proof.

Let $\text{depth} : Q \cup V \rightarrow \mathbb{N}$ give a node's (maximal) “distance” from the initial marking:

$$\text{depth}(p) := \max \left\{ \frac{d}{2} \mid d \in \mathbb{N}, \exists p_0 \in M_0 : (p_0, p) \in G^d \right\}$$

$$\text{depth}(t) := \max \{ \text{depth}(p) \mid p \in \bullet t \}$$

where $G^0 := \text{id}_Q$ and $G^{d+1} := G \circ G^d$.

Now construct the step sequence as follows:

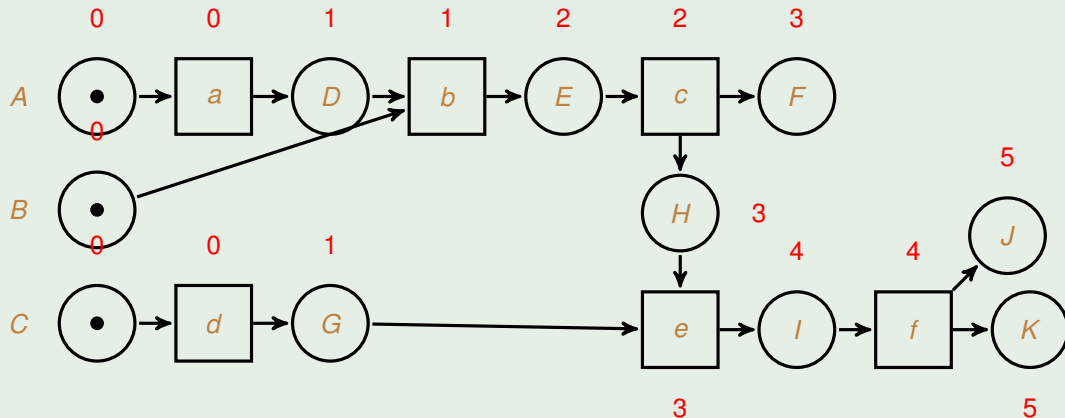

$$M_0 \xrightarrow{\underbrace{\hspace{2cm}}_{\text{all transitions of depth 0}}} \dots \xrightarrow{\hspace{1cm}} M_i \xrightarrow{\underbrace{\hspace{2cm}}_{\text{all transitions of depth 1}}} \dots \xrightarrow{\hspace{1cm}} M_j \longrightarrow \dots$$

such that all places and transitions are covered. □

Completeness of Causal Nets III

Example 15.12 (illustrating Lemma 15.11)

Causal net with **depth** information:

Completeness of Causal Nets III

Example 15.12 (illustrating Lemma 15.11)

Causal net with **depth** information:

Step sequence:

$$\{A, B, C\} \xrightarrow[\text{d=0}]{a \rightarrow d} \{B, D, G\} \xrightarrow[\text{d=1}]{b} \{E, G\} \xrightarrow[\text{d=2}]{c} \{F, G, H\} \xrightarrow[\text{d=3}]{e} \{F, I\} \xrightarrow[\text{d=4}]{f} \{F, J, K\}$$

Outline of Lecture 15

- 1 Recap: Interleaving Semantics of Petri Nets
- 2 Introduction
- 3 Nets with Infinite Node Sets
- 4 The True Concurrency Semantics of Petri Nets
- 5 Causal Nets
- 6 Distributed Runs**

Definition 15.13 (Outset and end of a causal net)

The **outset** and **end** of causal net $K = (Q, V, G, M_0)$ are defined by the places without an incoming or outgoing arc, respectively:

$${}^{\circ}K := \{q \in Q \mid \bullet q = \emptyset\} \quad K^{\circ} := \{q \in Q \mid q^{\bullet} = \emptyset\}.$$

What Is a Distributed Run?

Definition 15.14 (Distributed run)

A **distributed run** of a one-bounded elementary system net $N = (P, T, F, M_0)$ is

- (1) a **labelled** causal net $K_N = (Q, V, G, M)$
- (2) in which each transition $t \in V$ (with $\bullet t$ and $t \bullet$) is an **action** of N .

A distributed run K_N of N is **complete** if the marking $M = {}^\circ K_N$ represents the initial marking M_0 of N and the marking K_N° does not enable any transition in N .

If N is clear from the context, we just write K for K_N .

A Distributed Run for Mutual Exclusion

Example 15.15 (cf. Example 15.6)

Mutual exclusion algorithm (left) and an (incomplete) distributed run (right)

A Distributed Run for Mutual Exclusion

Example 15.15 (cf. Example 15.6)

Mutual exclusion algorithm (left) and an (incomplete) distributed run (right)

- Actions N_a , N_b , N_c and N_d **causally precede** N_e . They form a chain.
- N_a and N_d are not linked by actions; they are **causally independent**.
- The same applies to N_b and N_d and N_c and N_d .

Expansion of a Distributed Run

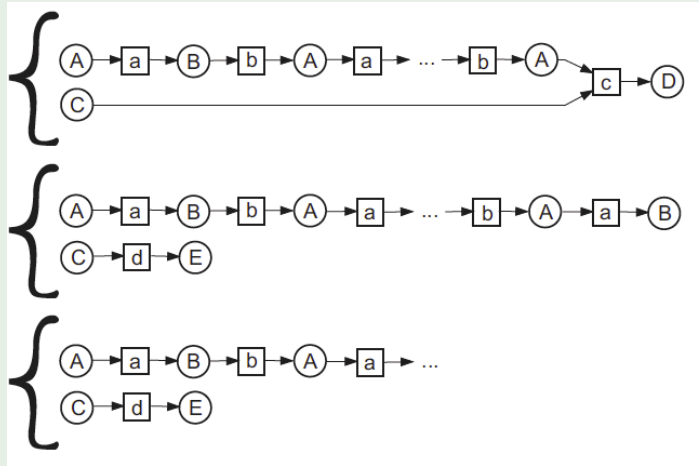

Example 15.16

An (incomplete) distributed run (top) and its extension with actions *a*, *b* and *c* (below)

More Distributed Runs

Example 15.17

Two finite distributed runs (first complete, second incomplete)

Causality Revisited

In contrast to sequential runs, distributed runs show the **causal order** of actions.

Example 15.18 (cf. Example 14.20)

- Both nets have identical sequential runs (*a* occurs before *b*, or vice versa).

Causality Revisited

In contrast to sequential runs, distributed runs show the **causal order** of actions.

Example 15.18 (cf. Example 14.20)

- Both nets have identical sequential runs (*a* occurs before *b*, or vice versa).
- But the left net only has the left distributed run below, the right net both ones:

Composition of Distributed Runs

Definition 15.19 (Composition of distributed runs)

For $i \in \{1, 2\}$, let $K_i = (Q_i, V_i, G_i, M_i)$ be causal nets, labelled with ℓ_i .

Let $(Q_1 \cup V_1) \cap (Q_2 \cup V_2) = K_1^\circ = {}^\circ K_2$ and for each $p \in K_1^\circ$, let $\ell_1(p) = \ell_2(p)$.

Composition of Distributed Runs

Definition 15.19 (Composition of distributed runs)

For $i \in \{1, 2\}$, let $K_i = (Q_i, V_i, G_i, M_i)$ be causal nets, labelled with ℓ_i .

Let $(Q_1 \cup V_1) \cap (Q_2 \cup V_2) = K_1^\circ = {}^\circ K_2$ and for each $p \in K_1^\circ$, let $\ell_1(p) = \ell_2(p)$.

The **composition** of K_1 and K_2 , denoted $K_1 \bullet K_2$, is the causal net $(Q_1 \cup Q_2, V_1 \cup V_2, G_1 \cup G_2, M_1)$ labelled with ℓ where $\ell(x) = \ell_i(x)$ if $x \in K_i$.

Composition of Distributed Runs

Definition 15.19 (Composition of distributed runs)

For $i \in \{1, 2\}$, let $K_i = (Q_i, V_i, G_i, M_i)$ be causal nets, labelled with ℓ_i .

Let $(Q_1 \cup V_1) \cap (Q_2 \cup V_2) = K_1^\circ = {}^\circ K_2$ and for each $p \in K_1^\circ$, let $\ell_1(p) = \ell_2(p)$.

The **composition** of K_1 and K_2 , denoted $K_1 \bullet K_2$, is the causal net $(Q_1 \cup Q_2, V_1 \cup V_2, G_1 \cup G_2, M_1)$ labelled with ℓ where $\ell(x) = \ell_i(x)$ if $x \in K_i$.

Intuition: The composition $K_1 \bullet K_2$ is formed by identifying the end K_1° of K_1 with the outset ${}^\circ K_2$ of K_2 . To do this, K_1° and ${}^\circ K_2$ must represent the same marking.

Composition of Distributed Runs

Definition 15.19 (Composition of distributed runs)

For $i \in \{1, 2\}$, let $K_i = (Q_i, V_i, G_i, M_i)$ be causal nets, labelled with ℓ_i .

Let $(Q_1 \cup V_1) \cap (Q_2 \cup V_2) = K_1^\circ = {}^\circ K_2$ and for each $p \in K_1^\circ$, let $\ell_1(p) = \ell_2(p)$.

The **composition** of K_1 and K_2 , denoted $K_1 \bullet K_2$, is the causal net $(Q_1 \cup Q_2, V_1 \cup V_2, G_1 \cup G_2, M_1)$ labelled with ℓ where $\ell(x) = \ell_i(x)$ if $x \in K_i$.

Intuition: The composition $K_1 \bullet K_2$ is formed by identifying the end K_1° of K_1 with the outset ${}^\circ K_2$ of K_2 . To do this, K_1° and ${}^\circ K_2$ must represent the same marking.

Example 15.20 (Composable runs)
